

MARGINS PLUS

KIT ITEMS

The Margins Plus kit system allows the user to set up a Bill of Material consisting of the individual items that make up the kit as well as the quantity needed from each component. The chief advantage of using a kit item in the Margins Plus system is that any time a user wants to view Inventory Information on a kit item, the system automatically researches the inventory information on its components and calculates the information for the Master Kit item. Since a kit item is created from components that can also be sold separately, and is usually put together as a result of a specific customer order, this method of inventory calculation proves much more useful than the method used for a true manufactured item. Where a true manufactured item is made up of raw materials and its quantity on-hand is increased upon completion of a production order, the on-hand for a master kit is determined strictly by the on-hand values of its components. Please review the example information that follows.

The kit master file listed below shows the Bill of Material for a rack of assorted candy. Each component is listed with the quantity required for each rack.

KIT MASTER FILE

ITEM CODE	COMPONENTS	QUANTITY	U.O.M.
Theater Rack-1	M&M	12	Boxes
Theater Rack-1	Snickers	12	Boxes
Theater Rack-1	Wire-Rack	1	Each

Note: U.O.M. - Unit of Measure

The "Margins Plus" system allows the user to use the Inventory Inquiry screen to view item information on either the Master Kit item or any of its components. Following is an illustration of the information that is displayed when looking up the Master Kit item.

ON HAND ANALYSIS

	On-Hand	Confirmed	Actual On-Hand	Committed	Available for Sale	On-Order
Theatre Rack-1	1	0	Kit	0	1	2
Total	1	0	Kit	0	1	0

(The On-Hand and On-Order numbers generated from the components below)

KIT ITEMS

Theater Rack-1	On-Hand	Confirmed	Actual On-Hand	Committed	Available for Sale	On-Order
M&M	12	0	12	0	12	24
Snickers	24	0	24	0	24	24
Wire-Rack	5	0	5	0	5	10

PLEASE NOTE: The on-hand value of 1 on the master kit item is generated by checking the on-hand for the component items. The system automatically determines how many kits can be made from the available components. Although the inventory on the master kit is a generated number based on its components, orders and/or purchase orders can be entered using the master kit item code. The system will adjust the component part values automatically. In addition, orders and/ or purchase orders can be entered using the component items individually. These features give the Margins Plus Kit System the flexibility to handle your kit sales easily and effectively

Let **MSEDP** help with your inventory dilemmas. . .

We'll find the solution to keep your business running smoothly.
